RCF-230CAD is a controller for controlling heating and/or cooling in a room. It is intended for control of actuators with 0...10 V DC analogue control signal, and also has a function for three-speed fan control (for fan-coil). The controller uses 230 V AC supply voltage. It has built-in 230 V AC fan relays, which means that a separate relay module is not required for the fan and actuators.

RCF-230CAD has communication via RS485 (Modbus, BACnet or EXOline) for integration into systems. The device can be configured using the Regio tool© software, downloadable free of charge from Regin’s website (www.regincontrols.com).

**Applications**
The controller is suitable in buildings where you want optimal comfort and reduced energy consumption, for example offices, schools, shopping centres, airports, hotels, hospitals etc.

**Easy to install**
The modular design with a separate bottom plate for wiring makes the controller easy to install and commission. The bottom plate can be put into place before the electronics are installed. Mounting takes place directly on a wall or wall socket.

**Control function**
The controller controls heating and/or cooling in a room. Control parameters like P-band and I-time can be set in the parameter list via the display or by using Regio tool©. The setpoint can be changed using the INCREASE (↑) and DECREASE (↓) buttons on the front.

See also the section “Display information and handling” on page 3.

**Built-in or external sensor**
The controller has a built-in sensor. Alternatively, the input for an external PT1000-sensor can be used.

**Output function for actuators with 0...10 V control**
The controller has 0...10 V DC outputs. Since it is powered by 230 V AC, the analogue signal neutral on the controller must, in addition to the control signal’s plus signal, be connected to the actuator in order for the control signal voltage to be transferred.

The output signal for the two outputs can be set individually to 0...10 V, 2...10 V, 10...0 V and 10...2 V. The factory setting is 0...10 V for both outputs.

**Communication protocols**
The room controller has automatic detection and switch-over between Modbus and EXOline. BACnet must however be set manually via the display or by using Regio tool©.
2- and 4-pipe installations
In 2-pipe installations, the same water system is used for heating as for cooling. Chilled water circulates through the system during summer and heated water during winter.
When RCF-230CAD is configured for a 2-pipe system, output AO1 is used for controlling heating or cooling (depending on the season (fluid temperature)) via an actuator, a valve or similar (change-over function).

In 4-pipe installations, there are two separate water systems for heating and cooling with separate valves. The controller uses two outputs for control of heating and cooling in sequence.

Automatic cooling/heating change-over
RCF-230CAD has an input for change-over which is used when the controller is configured for 2-pipe installations. It sets output AO1 to operate with heating or cooling function depending on the fluid temperature (season). The change-over input can be connected to a potential-free relay contact or a PT1000-sensor. The input function for the relay contact can be set to normally open (NO) or normally closed (NC). If the change-over input is not used, we recommend that it is left disconnected and set to NO (factory setting). When using a sensor, it must be mounted so that it can measure the temperature on the supply pipe to the coil. To ensure satisfactory function, the system must also have continuous primary circuit circulation. Using a sensor, the output function is set to heating when the fluid temperature exceeds 28°C and to cooling when the temperature falls below 16°C.
At heating function “HEAT” is shown in the display and at cooling function “COOL” is shown.

Occupancy detection for saving energy
By connecting an occupancy detector or a keycard switch (in hotels) to a digital input, you can alternate between Comfort and Economy mode. This way, the temperature is controlled from requirement, making it possible to save energy while maintaining the temperature at a comfortable level.

Using occupancy detection, you can delay activation and/or inactivation of Comfort mode to avoid switching mode if someone temporarily enters or leaves the room.
A window contact can be connected to either digital input 1 or universal input 1. The window contact will set the controller to “Off” mode if a window is opened, thereby minimising energy consumption.

Operating modes
There are four different operating modes, Comfort, Economy (Standby), Off and Window. Switching between these modes is performed locally or via the SCADA system.

Comfort: is shown in the display and the room is in use. The temperature is held at the comfort level with a deadband (DB) between activation of heating and cooling.

Economy (Standby): “Standby” is shown in the display. The room is in an energy saving mode and is not used at the moment. This can for example be during nights, weekends, evenings etc. or during daytime when there is no one in the room. The controller is prepared to change operating mode to Comfort if someone enters the room. Heating and cooling have freely adjustable setpoints.

Off: “Off” is shown in the display and the backlight is switched off. The controller neither heats or cools and the fan stops (except if mould protection has been selected, in which case the fan will keep running). Off mode is selected by pressing the On/Off button.

Window: is shown in the display and the controller is in off mode and the fan stops (except if mould protection has been selected, in which case the fan will keep running).

Fan speed control
The current fan speed is shown in the display and can be set manually to Low → Medium → High → Auto by pressing the fan button. In Auto mode, fan speed is controlled by the controller output.

When there is no heating or cooling demand in the Auto position, the fan will run at its lowest setting. This function can be changed to make the fan stop when there is no heating or cooling demand. The fan is also deactivated when in modes Off and Window. However, it will continue to run if mould protection has been configured.

If the fan has been configured to not be affected by controller output, the “AUTO” option will not be shown when pressing the fan button.

Mould protection
When this function has been configured, the fan will run at a minimum of the lowest speed setting, circulating air in the room so as to minimise the risk of mould growth in the fan-coil unit. The function is deactivated on delivery.

Automatic valve exercise
To ensure proper functionality, the controller has a function for valve exercise, even during periods when they are not in use. At regular intervals the output is overridden to close for a moment in order to open and close the valves. The exercise interval can be set individually for heating and cooling. The exercise function can also be inactivated if desired.
Display information and handling
The display has the following indications:

On/Off button
By pressing the On/Off button, RCF-230CAD will switch between Off mode and Comfort/Economy mode.

Setpoint buttons
The INCREASE and DECREASE buttons are used to change the setpoint value. The basic setpoint can be changed within adjustable min./max. limits.

Fan button
By pressing the fan button, the fan speed is set to Low, Medium, High or Auto.

Blocking
The buttons of the controller, the configuration menu and the manual fan control can all be blocked in order to prevent settings from being changed by unauthorized individuals.

Configuration
The factory settings can be changed by using the display and buttons on the controller, or alternatively by using Regio tool©.

The parameter values are changed with the INCREASE and DECREASE buttons and changes confirmed with the On/Off button.

The parameter list can be found in the instruction for RCF-230CAD and in the manual for RCF.

Display configuration
The desired contents of the display can be configured via the parameter list. There are four alternatives:

1. The actual value is normally shown. The setpoint is shown when it is changed using the INCREASE and DECREASE buttons.
2. The actual value is normally shown. The setpoint displacement is shown when it is changed using the INCREASE and DECREASE buttons.
3. The setpoint value is shown (factory setting).
4. The setpoint adjustment is shown.
Control principles

**Control principle at cooling function, 2-pipe installations**
During control of cooling, the output starts to increase when the temperature has exceeded the setpoint value.

**Control principle for heating function, 2-pipe installations**
During control of heating, the output starts to increase when the temperature has fallen below the setpoint value.

**Control principle in 4-pipe installations**
In order to minimise energy consumption at Comfort mode, neither heating nor cooling is used when the temperature lies within the deadband. The heating output is activated when the temperature has fallen below the set value for the deadband. The cooling output is activated when the temperature has exceeded the set value for the deadband. The deadband is divided into two equal parts with one part below and one part above the setpoint. See the figure below.

Supply air temperature limitation
AI1 can be configured for use with a supply air temperature limitation sensor. A room controller will then work together with a supply air temperature controller using cascade control, resulting in a calculated supply air temperature maintaining the room temperature setpoint. It is possible to set individual min/max limitation setpoints for heating and cooling. Settable temperature range: 10…50°C.
Technical data
Supply voltage 230 V AC ±10 %, 50/60 Hz
Power consumption 3 W, class II construction
Ambient temperature 0...50°C
Storage temperature -20...+70°C
Ambient humidity Max. 90 % RH
Protection class IP20
Communication RS485 (Modbus or EXOline with automatic detection/switching), or BACnet
Modbus 8 bits, 1 or 2 stop bits. Odd, even (FS) or no parity.
BACnet MS/TP slave and master
Communication speed 9600, 19200, 38400 bps (EXOline, Modbus and BACnet) or 76800 bps (BACnet only)
Pollution degree 2
Overvoltage category 3
Display LCD with backlight
Built-in temperature sensor NTC type, measuring range 0...50°C
Terminal blocks Lift type for max. cable area 2.1 mm²
Material, casing Polycarbonate, PC
Colour Signal white RAL 9003
Mounting Indoor, wall mounting, fits on a standard wall socket
Dimensions (HxWxD) 120 x 102 x 29 mm
Weight 0.18 kg

This product carries the CE mark.
For more information, see www.regincontrols.com.

Inputs
External sensor, AI1 PT1000-sensor. Suitable sensors are TG-R5/PT1000, TG-UH/PT1000, TG-A1/PT1000 and TG-K3-PT1000 from Regin.
UI1 Change-over, potential-free contact or PT1000-sensor. Suitable sensor is TG-A1/PT1000 from Regin or window contact.
Presence/window contact, DI1 Potential free contact. A suitable occupancy detector is IR24-P from Regin.

Outputs
Fan control, DO1, 2, 3 3 outputs for speed I, II and III, 230 V AC, max. 3 A fan-coil
Valve, DO4, DO5 2 outputs, 230 V AC, max. 300 mA (3 A initially)
Output AO1, AO2 0...10 V DC, max. 1 mA, short-circuit proof, reversible to 2...10 V, 10...0 V, 10...2 V
